

Use cases

Which practical cases can be addressed by Eternity Wall?

Eternity Wall allows to demonstrate integrity and existence at a certain date of any piece of digital information in various contexts:

Proof of integrity for regulators

An organization may be asked to certify in advance the integrity of its own data to follow some regulations (e.g. Dodd-Frank Act). Eternity Wall allows to certify data at a fraction of the cost and independently.

Offer indisputable data to your clients

The same customers of an organization may be interested in having a proof of the integrity of their own data. The Eternity Wall authenticated API allows to offer certified data to third parties.

Transparency with suppliers and partners

Trust with suppliers and partners is essential. Eternity Wall allows to create integrity proofs of data and shared processes.

Indisputable dates associated with my data

Whether my datum is a file, a signature, a line in a database, an email or a message (as in the case of IoT protocols) it is essential to have an indisputable and tamper resistant date associated with it.
